**BMP-3 Antibody - Protein Information**

**Name** BMP3**Synonyms** BMP3A**Function**

Growth factor of the TGF-beta superfamily that plays an essential role in developmental process by inducing and patterning early skeletal formation and by negatively regulating bone density. Antagonizes the ability of certain osteogenic BMPs to induce osteoprogenitor differentiation and ossification (PubMed: [11138004](http://www.uniprot.org/citations/11138004), PubMed: [15269709](http://www.uniprot.org/citations/15269709)). Initiates signaling cascades by associating with type II receptor ACVR2B to activate SMAD2-dependent and SMAD-independent signaling cascades including TAK1 and JNK pathways (PubMed: [31665064](http://www.uniprot.org/citations/31665064)).

**Cellular Location**

Secreted.

**Tissue Location**

Expressed in adult and fetal cartilage.

BMPs (bone morphogenetic proteins) belong to the TGF- $\beta$  superfamily of structurally related signaling proteins. As implied by their name, BMPs promote and regulate bone development, growth, remodeling and repair, in both prenatal development and postnatal growth of eye, heart, kidney, skin, and other tissues. Recombinant human BMP-3 is a 31.6 kDa homodimeric protein consisting of two 134 amino acid polypeptide chains.
