

# **HLA-B Antibody (Clone # 7G7F9)**

Mouse Monoclonal Antibody Catalog # ABV11329

# **Specification**

# HLA-B Antibody (Clone # 7G7F9) - Product Information

Application WB
Other Accession N/A
Host Mouse
Clonality Monoclonal
Isotype Mouse IgM

#### HLA-B Antibody (Clone # 7G7F9) - Additional Information

Positive Control Western blot: Ramos cell lysate.

Application & Usage WB: 1:100 - 1:250.

**Other Names** 

HLA-B; HLAB; HLA class I histocompatibility antigen, B-27 alpha chain; MHC class I antigen B\*27

**Target/Specificity** 

HLA-B

**Antibody Form** 

Liquid

**Appearance** 

Colorless liquid

**Formulation** 

This antibody is prepared by Euglobin precipitation followed by dialysis against PBS.

**Handling** 

The antibody solution should be gently mixed before use.

**Reconstitution & Storage** 

-20 °C

**Background Descriptions** 

**Precautions** 

HLA-B Antibody (Clone # 7G7F9) is for research use only and not for use in diagnostic or therapeutic procedures.

# HLA-B Antibody (Clone # 7G7F9) - Protein Information

### **HLA-B Antibody (Clone # 7G7F9) - Protocols**

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- <u>Immunohistochemistry</u>
- Immunofluorescence
- <u>Immunoprecipitation</u>
- Flow Cytomety
- Cell Culture

#### HLA-B Antibody (Clone # 7G7F9) - Background

Major histocompatibility complex (MHC) molecules form an integral part of the immune response system. They are cell-surface receptors that bind peptides and present them to T lymphocytes. Human leukocyte antigens (HLAs) are polymorphic members of the MHC family that are specifically involved in the presentation of antigens to the T cell receptor. There are two classes of HLA antigens: class I (HLA-A, HLA-B and HLA-C) and class II (HLA-D). Class I molecules are expressed in nearly all cells and play a central role in the immune system by presenting peptides derived from the endoplasmic reticulum. The differential structural properties of MHC class I and class II molecules account for their respective roles in activating different populations of T lymphocytes. HLA-B and HLA-C encode membrane anchored heavy chains which heterodimerize with a light chain (5-2-Microglobulin) to form MHC-I. Polymorphisms yield hundreds of HLA-B and HLA-C alleles.
