

## H4K20me1 monoclonal antibody

Rabbit Polyclonal Antibody Catalog # ABV11354

## **Specification**

# H4K20me1 monoclonal antibody - Product Information

Application WB, E, DB
Primary Accession P68431
Host Rabbit
Clonality Polyclonal
Isotype Rabbit IgG
Calculated MW 15404

## H4K20me1 monoclonal antibody - Additional Information

Gene ID 8350;8351;8352;8353;8354;8355;8356;8357;8358;8968

Positive Control Western blot: HeLa cells, ELISA: Antigen,

ChIP: HeLa cells, Dot blot: Histone

Peptides.

Application & Usage ChIP: 5-10 µl/ChIP, WB: 1:750, ELISA: 1:300

- 1:1000, Dot Blot: 1:20,000.

.. 3

Other Names Histone H4

Target/Specificity

H4K20me1

**Antibody Form** 

Liquid

**Appearance** 

Colorless liquid

**Formulation** 

In PBS with 0.05% (W/V) sodium azide.

**Handling** 

The antibody solution should be gently mixed before use.

**Reconstitution & Storage** 

-20 °C

**Background Descriptions** 

#### **Precautions**

H4K20me1 monoclonal antibody is for research use only and not for use in diagnostic or therapeutic procedures.

### H4K20me1 monoclonal antibody - Protein Information

Name H3C1 (<u>HGNC:4766</u>)

Synonyms H3FA, HIST1H3A

### **Function**

Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.

**Cellular Location** 

Nucleus. Chromosome.

# H4K20me1 monoclonal antibody - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- Immunohistochemistry
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

## H4K20me1 monoclonal antibody - Images

## H4K20me1 monoclonal antibody - Background

Histones are the main constituents of the protein part of chromosomes of eukaryotic cells. They are rich in the amino acids arginine and lysine and have been greatly conserved during evolution. Histones pack the DNA into tight masses of chromatin. Two core histones of each class H2A, H2B, H3 and H4 assemble and are wrapped by 146 base pairs of DNA to form one octameric nucleosome. Histone tails undergo numerous post-translational modifications, which either directly or indirectly alter chromatin structure to facilitate transcriptional activation or repression or other nuclear processes. In addition to the genetic code, combinations of the different histone modifications reveal the so-called "histone code". Histone methylation and demethylation is dynamically regulated by respectively histone methyl transferases and histone demethylases.
