**Mouse Monoclonal Antibody to Rab6b - Protein Information**

**Name** RAB6B ([HGNC:14902](#))

**Function**

The small GTPases Rab are key regulators of intracellular membrane trafficking, from the formation of transport vesicles to their fusion with membranes. Rabs cycle between active GTP-bound and inactive GDP-bound states. In their active state, drive transport of vesicular

carriers from donor organelles to acceptor organelles to regulate the membrane traffic that maintains organelle identity and morphology (Probable). Recruits VPS13B to the Golgi membrane (PubMed:<a href="http://www.uniprot.org/citations/25492866" target="\_blank">25492866</a>). Regulates the compacted morphology of the Golgi (PubMed:<a href="http://www.uniprot.org/citations/26209634" target="\_blank">26209634</a>). Seems to have a role in retrograde membrane traffic at the level of the Golgi complex. May function in retrograde transport in neuronal cells (PubMed:<a href="http://www.uniprot.org/citations/17707369" target="\_blank">17707369</a>). Plays a role in neuron projection development (PubMed:<a href="http://www.uniprot.org/citations/25492866" target="\_blank">25492866</a>).

### Cellular Location

Golgi apparatus membrane; Lipid-anchor. Endoplasmic reticulum-Golgi intermediate compartment Cytoplasmic vesicle. Note=Colocalizes with BICD1 at vesicular structures that align along microtubules

### Tissue Location

Predominantly expressed in brain.
