BCL7B Antibody (C-term) - Protein Information

Name BCL7B

Function Positive regulator of apoptosis. Plays a role in the Wnt signaling pathway, negatively regulating the expression of Wnt signaling components CTNNB1 and HMGA1 (PubMed:[25569233](#)). Involved in cell cycle progression, maintenance of the nuclear structure and stem cell differentiation (PubMed:[25569233](#)). May play a role in lung tumor development or progression (By similarity).

Tissue Location

Ubiquitous.

BCL7B Antibody (C-term) - Background

This gene encodes a member of the BCL7 family including BCL7A, BCL7B and BCL7C proteins. This member is BCL7B, which contains a region that is highly similar to the N-terminal segment of BCL7A or BCL7C proteins. The BCL7A protein is encoded by the gene known to be directly involved in a three-way gene translocation in a Burkitt lymphoma cell line. This gene is located at a chromosomal region commonly deleted in Williams syndrome. This gene is highly conserved from *C. elegans* to human. Multiple alternatively spliced transcript variants have been found for this gene.
