LGALS8 Antibody (C-term) - Protein Information

Name LGALS8 (<u>HGNC:6569</u>)

Function Beta-galactoside-binding lectin that acts as a sensor of membrane damage caused by infection and restricts the proliferation of infecting pathogens by targeting them for autophagy

(PubMed:<u>22246324</u>, PubMed:<u>28077878</u>). Detects membrane rupture by binding beta-galactoside ligands located on the lumenal side of the endosome membrane; these ligands becoming exposed to the cytoplasm following rupture (PubMed:<u>22246324</u>, PubMed:<u>28077878</u>). Restricts infection by initiating autophagy via interaction with CALCOCO2/NDP52 (PubMed:<u>22246324</u>, PubMed:<u>28077878</u>). Required to restrict infection of bacterial invasion such as S.typhimurium (PubMed:<u>22246324</u>). Also required to restrict infection of Picornaviridae viruses (PubMed:<u>28077878</u>). Has a marked preference for 3'-O-sialylated and 3'-O-sulfated glycans (PubMed:<u>21288902</u>).

Cellular Location Cytoplasmic vesicle. Cytoplasm, cytosol

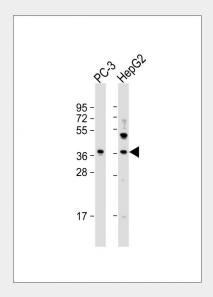

Tissue Location Ubiquitous. Selective expression by prostate carcinomas versus normal prostate and benign prostatic hypertrophy

LGALS8 Antibody (C-term) - Background

This gene encodes a member of the galectin family. Galectins are beta-galactoside-binding animal lectins with conserved carbohydrate recognition domains. The galectins have been implicated in many essential functions including development, differentiation, cell-cell adhesion, cell-matrix interaction, growth regulation, apoptosis, and RNA splicing. This gene is widely expressed in tumoral tissues and seems to be involved in integrin-like cell interactions. Alternatively spliced transcript variants encoding different isoforms have been identified.
