

**Swine H1N1 Neuraminidase Antibody**  
**Catalog # ASC10936****Specification**

---

**Swine H1N1 Neuraminidase Antibody - Product Information**

Application	E
Primary Accession	<a href="#">C4AL28</a>
Other Accession	<a href="#">ACQ76308</a> , <a href="#">229535824</a>
Reactivity	Virus
Host	Rabbit
Clonality	Polyclonal
Isotype	IgG
Application Notes	Neuraminidase antibody can be used for the detection of the Neuraminidase protein from the H1N1 strain of swine influenza A in ELISA. It will detect 2 ng of free peptide at 1 µg/mL

**Swine H1N1 Neuraminidase Antibody - Additional Information****Target/Specificity**

NA; This antibody is specific for the novel swine influenza Neuraminidase and will not recognize the corresponding Neuraminidase sequence from the seasonal H1N1 influenza (A/Georgia/20/2006 (H1N1)). Will not cross-react with peptide corresponding to the seasonal influenza (H1N1) Neuraminidase.

**Reconstitution & Storage**

Swine H1N1 Neuraminidase antibody can be stored at 4°C for three months and -20°C, stable for up to one year. As with all antibodies care should be taken to avoid repeated freeze thaw cycles. Antibodies should not be exposed to prolonged high temperatures.

**Precautions**

Swine H1N1 Neuraminidase Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

**Swine H1N1 Neuraminidase Antibody - Protein Information****Swine H1N1 Neuraminidase Antibody - Protocols**

Provided below are standard protocols that you may find useful for product applications.

## Swine H1N1 Neuraminidase Antibody - Images

ELISA results using Swine H1N1 Neuraminidase antibody at 1 µg/mL and the blocking and corresponding peptides at 50, 10, 2 and 0 ng/mL.

## Swine H1N1 Neuraminidase Antibody - Background

Swine H1N1 Neuraminidase Antibody: Influenza A virus is a major public health threat, killing more than 30,000 people per year in the USA. In early 2009, a novel swine-origin influenza A (H1N1) virus was identified in specimens obtained from patients in Mexico and the United States. The virus spread quickly around the world and on June 11, 2009, the World Health Organization declared it a pandemic. Influenza A virus has one of sixteen possible Hemagglutinin (HA) surface proteins and one of nine possible Neuraminidase (NA) surface proteins. The Hemagglutinin protein facilitates viral attachment while Neuraminidase is involved in viral release. These proteins also elicit immune responses that prevent infection or independently reduce viral replication. The genetic make-up of this swine flu virus is unlike any other: it is an H1N1 strain that combines a triple assortment first identified in 1998 including human, swine, and avian influenza with two new pig H3N2 virus genes from Eurasia, themselves of recent human origin. The distinct antigenic properties of the new swine influenza virus compared with seasonal influenza A (H1N1) virus suggest that human immunity against new swine influenza virus is limited, although the age distribution of reported cases suggests some degree of protection in older age groups.
