

MPYS Antibody

Catalog # ASC10946

Specification

MPYS Antibody - Product Information

Application Primary Accession Other Accession Reactivity

Host Clonality Isotype

Calculated MW

Application Notes

IF.

Q86WV6

NP 938023, 340061 Human, Mouse

Rabbit Polyclonal

IaG

Predicted: 31, 42 kDa

Observed: 37 kDa KDa

MPYS antibody can be used for detection of MPYS by Western blot at 1 µg/mL.

Antibody can also be used for

immunocytochemistry starting at 5 µg/mL. For immunofluorescence start at 20 µg/mL.

MPYS Antibody - Additional Information

340061 Gene ID

Target/Specificity

MPYS antibody was raised against a 17 amino acid synthetic peptide near the carboxy terminus of human MPYS.
 The immunogen is located within amino acids 260 - 310 of MPYS.

Reconstitution & Storage

MPYS antibody can be stored at 4°C for three months and -20°C, stable for up to one year. As with all antibodies care should be taken to avoid repeated freeze thaw cycles. Antibodies should not be exposed to prolonged high temperatures.

Precautions

MPYS Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

MPYS Antibody - Protein Information

Name STING1 (HGNC:27962)

Function

Facilitator of innate immune signaling that acts as a sensor of cytosolic DNA from bacteria and viruses and promotes the production of type I interferon (IFN-alpha and IFN-beta) (PubMed: 18724357, PubMed:18818105, PubMed:19433799, PubMed:19776740, PubMed:23027953, PubMed:<a

```
href="http://www.uniprot.org/citations/23910378" target=" blank">23910378</a>, PubMed:<a
href="http://www.uniprot.org/citations/23747010" target="blank">23747010</a>, PubMed:<a
href="http://www.uniprot.org/citations/29973723" target="_blank">29973723</a>, PubMed:<a href="http://www.uniprot.org/citations/30842659" target="_blank">30842659</a>, PubMed:<a
href="http://www.uniprot.org/citations/35045565" target="blank">35045565</a>, PubMed:<a
href="http://www.uniprot.org/citations/27801882" target="blank">27801882</a>, PubMed:<a
href="http://www.uniprot.org/citations/36808561" target="_blank">36808561</a>). Innate
immune response is triggered in response to non-CpG double-stranded DNA from viruses and
bacteria delivered to the cytoplasm (PubMed:<a href="http://www.uniprot.org/citations/26300263"
target=" blank">26300263</a>). Acts by binding cyclic dinucleotides: recognizes and binds cyclic
di-GMP (c- di-GMP), a second messenger produced by bacteria, and cyclic GMP-AMP (cGAMP), a
messenger produced by CGAS in response to DNA virus in the cytosol (PubMed:<a
href="http://www.uniprot.org/citations/21947006" target=" blank">21947006</a>, PubMed:<a
href="http://www.uniprot.org/citations/23258412" target=" blank">23258412</a>, PubMed:<a
href="http://www.uniprot.org/citations/23707065" target="blank">23707065</a>, PubMed:<a
href="http://www.uniprot.org/citations/23722158" target="blank">23722158</a>, PubMed:<a
href="http://www.uniprot.org/citations/26229117" target="blank">26229117</a>, PubMed:<a
href="http://www.uniprot.org/citations/23910378" target="_blank">23910378</a>, PubMed:<a
href="http://www.uniprot.org/citations/23747010" target="blank">23747010</a>, PubMed:<a
href="http://www.uniprot.org/citations/30842659" target="blank">30842659</a>). Upon binding
of c-di-GMP or cGAMP, STING1 oligomerizes, translocates from the endoplasmic reticulum and is
phosphorylated by TBK1 on the pLxIS motif, leading to recruitment and subsequent activation of
the transcription factor IRF3 to induce expression of type I interferon and exert a potent anti-viral
state (PubMed:<a href="http://www.uniprot.org/citations/22394562"
target=" blank">22394562</a>, PubMed:<a href="http://www.uniprot.org/citations/25636800"
target="blank">25636800</a>, PubMed:<a href="http://www.uniprot.org/citations/29973723"
target="blank">29973723</a>, PubMed:<a href="http://www.uniprot.org/citations/30842653"
target=" blank">30842653</a>, PubMed:<a href="http://www.uniprot.org/citations/35045565"
target=" blank">35045565</a>). In addition to promote the production of type I interferons,
plays a direct role in autophagy (PubMed:<a href="http://www.uniprot.org/citations/30568238"
target=" blank">30568238</a>, PubMed:<a href="http://www.uniprot.org/citations/30842662"
target=" blank">30842662</a>). Following cGAMP-binding, STING1 buds from the endoplasmic
reticulum into COPII vesicles, which then form the endoplasmic reticulum-Golgi intermediate
compartment (ERGIC) (PubMed: <a href="http://www.uniprot.org/citations/30842662"
target=" blank">30842662</a>). The ERGIC serves as the membrane source for WIPI2
recruitment and LC3 lipidation, leading to formation of autophagosomes that target cytosolic DNA
or DNA viruses for degradation by the lysosome (PubMed:<a
href="http://www.uniprot.org/citations/30842662" target="_blank">30842662</a>). The
autophagy- and interferon-inducing activities can be uncoupled and autophagy induction is
independent of TBK1 phosphorylation (PubMed:<a
href="http://www.uniprot.org/citations/30568238"\ target="\_blank">30568238</a>, PubMed:<a
href="http://www.uniprot.org/citations/30842662" target="blank">30842662</a>). Autophagy is
also triggered upon infection by bacteria: following c-di-GMP-binding, which is produced by live
Gram-positive bacteria, promotes reticulophagy (By similarity). Exhibits 2',3' phosphodiester
linkage- specific ligand recognition: can bind both 2'-3' linked cGAMP (2'-3'- cGAMP) and 3'-3'
linked cGAMP but is preferentially activated by 2'-3' linked cGAMP (PubMed:<a
href="http://www.uniprot.org/citations/26300263" target="_blank">26300263</a>, PubMed:<a
href="http://www.uniprot.org/citations/23910378" target="blank">23910378</a>, PubMed:<a
href="http://www.uniprot.org/citations/23747010" target="blank">23747010</a>). The
preference for 2'-3'-cGAMP, compared to other linkage isomers is probably due to the ligand itself,
whichs adopts an organized free- ligand conformation that resembles the STING1-bound
conformation and pays low energy costs in changing into the active conformation (PubMed: <a
href="http://www.uniprot.org/citations/26150511" target="_blank">26150511</a>). May be
involved in translocon function, the translocon possibly being able to influence the induction of
type I interferons (PubMed:<a href="http://www.uniprot.org/citations/18724357"
target=" blank">18724357</a>). May be involved in transduction of apoptotic signals via its
association with the major histocompatibility complex class II (MHC-II) (By similarity).
```

Cellular Location

Endoplasmic reticulum membrane; Multi-pass membrane protein {ECO:0000255, ECO:0000269|PubMed:30842659, ECO:0000269|PubMed:32690950}. Cytoplasm, perinuclear region. Endoplasmic reticulum-Golgi intermediate compartment membrane; Multi-pass membrane protein {ECO:0000255, ECO:0000269|PubMed:32690950}. Golgi apparatus membrane; Multi-pass membrane protein. Cytoplasmic vesicle, autophagosome membrane; Multi-pass membrane protein. Mitochondrion outer membrane; Multi-pass membrane protein. Cell membrane {ECO:0000250|UniProtKB:Q3TBT3}; Multi-pass membrane protein. Note=In response to double-stranded DNA stimulation, translocates from the endoplasmic reticulum through the endoplasmic reticulum-Golgi intermediate compartment and Golgi to post-Golgi vesicles, where the kinase TBK1 is recruited (PubMed:19433799, PubMed:30842659, PubMed:30842653, PubMed:29694889). Upon cGAMP-binding, translocates to the endoplasmic reticulum-Golgi intermediate compartment (ERGIC) in a process that is dependent on COPII vesicles; STING1-containing ERGIC serves as a membrane source for LC3 lipidation, which is a key step in autophagosome biogenesis (PubMed:30842662)

Tissue Location

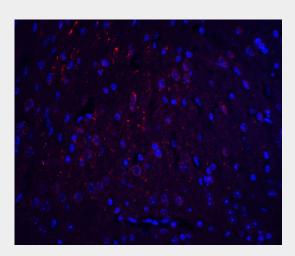

Ubiquitously expressed. Expressed in skin endothelial cells, alveolar type 2 pneumocytes, bronchial epithelium and alveolar macrophages.

MPYS Antibody - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- <u>Immunohistochemistry</u>
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

MPYS Antibody - Images

Immunofluorescence of HOOK3 in mouse brain tissue with HOOK3 antibody at 20 μg/ml.

MPYS Antibody - Background

MPYS Antibody: MPYS is a recently identified plasma membrane tetraspanner that is associated

with major histocompatibility complex class II (MHC-II) and mediates its transduction of apoptotic signals. It has also been found to be associated with VISA, a mitochondrial protein that acts as an adaptor in virus-triggered signaling. MPYS also interacts with IRF3 and recruits the kinase TBK1 to the VISA-associated complex, acting as a critical mediator of virus-triggered IRF3 activation and interferon (IFN) expression. It is thought that the binding of nucleic acid to the innate immune protein RIG-I causes complex formation between RIG-I, VISA, and MPYS. This complex then recruits TBK1 to phosphorylate IRF3 which then directly activates IFN transcription. At least three isoforms of MPYS are known to exist.
