ALX4 Antibody (Center) Blocking peptide

Synthetic peptide
Catalog # BP10386c

Specification

ALX4 Antibody (Center) Blocking peptide - Product Information

Primary Accession	Q9H161
Other Accession	NP_068745.2

ALX4 Antibody (Center) Blocking peptide - Additional Information

Gene ID 60529

Other Names
Homeobox protein aristaless-like 4, ALX4, KIAA1788

Format
Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage
Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions
This product is for research use only. Not for use in diagnostic or therapeutic procedures.

ALX4 Antibody (Center) Blocking peptide - Protein Information

Name ALX4

Synonyms KIAA1788

Function
Transcription factor involved in skull and limb development. Plays an essential role in craniofacial development, skin and hair follicle development.

Cellular Location
Nucleus {ECO:0000255|PROSITE-ProRule:PRU00108, ECO:0000255|PROSITE-ProRule:PRU00138, ECO:0000269|PubMed:19692347}

Tissue Location
Expression is likely to be restricted to bone. Found in parietal bone

ALX4 Antibody (Center) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

ALX4 Antibody (Center) Blocking peptide - Background

This gene encodes a paired-like homeodomain transcriptionfactor expressed in the mesenchyme of developing bones, limbs,hair, teeth, and mammary tissue. Mutations in this gene causeparietal foramina 2 (PFM2); an autosomal dominant diseasecharacterized by deficient ossification of the parietal bones.Mutations in this gene also cause a form of frontonasal dysplasiawith alopecia and hypogonadism; suggesting a role for this gene incraniofacial development, mesenchymal-epithelial communication, andhair follicle development. Deletion of a segment of chromosome 11containing this gene, del(11)(p11p12), causes Potocki-Shaffersyndrome (PSS); a syndrome characterized by craniofacial anomalies,mental retardation, multiple exostoses, and genital abnormalitiesin males. In mouse, this gene has been shown to use dualtranslation initiation sites located 16 codons apart. [provided byRefSeq].
