

HDAC11 Antibody (N-term) Blocking Peptide

Synthetic peptide Catalog # BP1111a

Specification

HDAC11 Antibody (N-term) Blocking Peptide - Product Information

Primary Accession Q96DB2
Other Accession NP 079103

HDAC11 Antibody (N-term) Blocking Peptide - Additional Information

Gene ID 79885

Other Names

Histone deacetylase 11, HD11, HDAC11

Target/Specificity

The synthetic peptide sequence used to generate the antibody AP1111a was selected from the N-term region of human HDAC11. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

HDAC11 Antibody (N-term) Blocking Peptide - Protein Information

Name HDAC11

Function

Responsible for the deacetylation of lysine residues on the N-terminal part of the core histones (H2A, H2B, H3 and H4). Histone deacetylation gives a tag for epigenetic repression and plays an important role in transcriptional regulation, cell cycle progression and developmental events. Histone deacetylases act via the formation of large multiprotein complexes.

Cellular Location

Nucleus.

Tissue Location

Weakly expressed in most tissues. Strongly expressed in brain, heart, skeletal muscle, kidney and testis

HDAC11 Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

HDAC11 Antibody (N-term) Blocking Peptide - Background

HDAC11 is responsible for the deacetylation of lysine residues on the N-terminal part of the core histones (H2A, H2B, H3 and H4). Histone deacetylation gives a tag for epigenetic repression and plays an important role in transcriptional regulation, cell cycle progression and developmental events. Histone deacetylases act via the formation of large multiprotein complexes. The predominantly nuclear HDAC11, which interacts with HDAC6, is weakly expressed in most tissues, and strongly expressed in brain, heart, skeletal muscle, kidney and testis. Its activity is inhibited by trapoxin, a known histone deacetylase inhibitor.
