

POU2F1 Antibody (Center) Blocking peptide

Synthetic peptide Catalog # BP11702c

Specification

POU2F1 Antibody (Center) Blocking peptide - Product Information

Primary Accession

P14859

POU2F1 Antibody (Center) Blocking peptide - Additional Information

Gene ID 5451

Other Names

POU domain, class 2, transcription factor 1, NF-A1, Octamer-binding protein 1, Oct-1, Octamer-binding transcription factor 1, OTF-1, POU2F1, OCT1, OTF1

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

POU2F1 Antibody (Center) Blocking peptide - Protein Information

Name POU2F1

Synonyms OCT1, OTF1

Function

Transcription factor that binds to the octamer motif (5'- ATTTGCAT-3') and activates the promoters of the genes for some small nuclear RNAs (snRNA) and of genes such as those for histone H2B and immunoglobulins. Modulates transcription transactivation by NR3C1, AR and PGR.

Cellular Location

Nucleus.

Tissue Location

Ubiquitous. Isoform 2 is lymphocyte-specific.

POU2F1 Antibody (Center) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

• Blocking Peptides

POU2F1 Antibody (Center) Blocking peptide - Background

This gene encodes a member of the paired box (PAX) familyof transcription factors. The central feature of this gene familyis a novel, highly conserved DNA-binding motif, known as the pairedbox. PAX proteins are important regulators in early development, and alterations in the expression of their genes are thought tocontribute to neoplastic transformation. This gene encodes theB-cell lineage specific activator protein that is expressed atearly, but not late stages of B-cell differentiation. Itsexpression has also been detected in developing CNS and testis andso the encoded protein may also play a role in neural developmentand spermatogenesis. This gene is located at 9p13, which isinvolved in t(9;14)(p13;q32) translocations recurring in smalllymphocytic lymphomas of the plasmacytoid subtype, and in derivedlarge-cell lymphomas. This translocation brings the potent E-muenhancer of the IgH gene into close proximity of the PAX5 promoter, suggesting that the deregulation of transcription of this genecontributes to the pathogenesis of these lymphomas. Alternativelyspliced transcript variants encoding different isoforms have beendescribed but their biological validity has not been determined.
