

GRM6 Antibody (Center) Blocking peptide Synthetic peptide

Catalog # BP13735c

Specification

GRM6 Antibody (Center) Blocking peptide - Product Information

Primary Accession

<u>015303</u>

GRM6 Antibody (Center) Blocking peptide - Additional Information

Gene ID 2916

Other Names Metabotropic glutamate receptor 6, mGluR6, GRM6, GPRC1F, MGLUR6

Target/Specificity

The synthetic peptide sequence used to generate the antibody AP13735c was selected from the Center region of GRM6. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

GRM6 Antibody (Center) Blocking peptide - Protein Information

Name GRM6

Synonyms GPRC1F, MGLUR6

Function

G-protein coupled receptor for glutamate. Ligand binding causes a conformation change that triggers signaling via guanine nucleotide-binding proteins (G proteins) and modulates the activity of down-stream effectors, such as adenylate cyclase. Signaling inhibits adenylate cyclase activity (By similarity). Signaling stimulates TRPM1 channel activity and Ca(2+) uptake. Required for normal vision.

Cellular Location

Cell membrane; Multi-pass membrane protein. Endoplasmic reticulum membrane; Multi-pass membrane protein. Golgi apparatus membrane; Multi-pass membrane protein. Cell projection, dendrite Note=Subject to trafficking from the endoplasmic reticulum to the Golgi apparatus and then to the cell membrane

Tissue Location Detected in melanocytes.

GRM6 Antibody (Center) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

GRM6 Antibody (Center) Blocking peptide - Background

L-glutamate is the major excitatory neurotransmitter in the central nervous system and activates both ionotropic andmetabotropic glutamate receptors. Glutamatergic neurotransmissionis involved in most aspects of normal brain function and can beperturbed in many neuropathologic conditions. The metabotropicglutamate receptors are a family of G protein-coupled receptors, that have been divided into 3 groups on the basis of sequencehomology, putative signal transduction mechanisms, andpharmacologic properties. Group I includes GRM1 and GRM5 and thesereceptors have been shown to activate phospholipase C. Group Ilincludes GRM2 and GRM3 while Group III includes GRM4, GRM6, GRM7and GRM8. Group II and III receptors are linked to the inhibition of the cyclic AMP cascade but differ in their agonistselectivities.
