

PVRL1 Antibody (C-term) Blocking Peptide Synthetic peptide

Catalog # BP14522b

Specification

PVRL1 Antibody (C-term) Blocking Peptide - Product Information

Primary Accession

<u>Q15223</u>

PVRL1 Antibody (C-term) Blocking Peptide - Additional Information

Gene ID 5818

Other Names

Nectin-1, Herpes virus entry mediator C, Herpesvirus entry mediator C, HveC, Herpesvirus Ig-like receptor, HIgR, Poliovirus receptor-related protein 1, CD111, PVRL1, HVEC, PRR1

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions This product is for research use only. Not for use in diagnostic or therapeutic procedures.

PVRL1 Antibody (C-term) Blocking Peptide - Protein Information

Name NECTIN1 (<u>HGNC:9706</u>)

Synonyms HVEC, PRR1, PVRL1

Function

Promotes cell-cell contacts by forming homophilic or heterophilic trans-dimers. Heterophilic interactions have been detected between NECTIN1 and NECTIN3 and between NECTIN1 and NECTIN4. Has some neurite outgrowth-promoting activity.

Cellular Location

[Isoform Alpha]: Cell membrane; Single-pass type I membrane protein. Presynaptic cell membrane [Isoform Gamma]: Secreted.

PVRL1 Antibody (C-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

PVRL1 Antibody (C-term) Blocking Peptide - Background

This gene encodes an adhesion protein that plays a role inthe organization of adherens junctions and tight junctions inepithelial and endothelial cells. The protein is acalcium(2+)-independent cell-cell adhesion molecule that belongs tothe immunoglobulin superfamily and has 3 extracellularimmunoglobulin-like loops, a single transmembrane domain (in someisoforms), and a cytoplasmic region. This protein acts as areceptor for glycoprotein D (gD) of herpes simplex viruses 1 and 2(HSV-1, HSV-2), and pseudorabies virus (PRV) and mediates viralentry into epithelial and neuronal cells. Mutations in this genecause cleft lip and palate/ectodermal dysplasia 1 syndrome (CLPED1)as well as non-syndromic cleft lip with or without cleft palate(CL/P). Alternative splicing results in multiple transcriptvariants encoding proteins with distinct C-termini. [provided byRefSeq].
