

TGM3 Antibody (C-term) Blocking Peptide

Synthetic peptide Catalog # BP17540b

Specification

TGM3 Antibody (C-term) Blocking Peptide - Product Information

Primary Accession

Q08188

TGM3 Antibody (C-term) Blocking Peptide - Additional Information

Gene ID 7053

Other Names

Protein-glutamine gamma-glutamyltransferase E, Transglutaminase E, TG(E), TGE, TGase E, Transglutaminase-3, TGase-3, Protein-glutamine gamma-glutamyltransferase E 50 kDa catalytic chain, Protein-glutamine gamma-glutamyltransferase E 27 kDa non-catalytic chain, TGM3

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

TGM3 Antibody (C-term) Blocking Peptide - Protein Information

Name TGM3

Function

Catalyzes the calcium-dependent formation of isopeptide cross-links between glutamine and lysine residues in various proteins, as well as the conjugation of polyamines to proteins. Involved in the formation of the cornified envelope (CE), a specialized component consisting of covalent cross-links of proteins beneath the plasma membrane of terminally differentiated keratinocytes. Catalyzes small proline-rich proteins (SPRR1 and SPRR2) and LOR cross-linking to form small interchain oligomers, which are further cross-linked by TGM1 onto the growing CE scaffold (By similarity). In hair follicles, involved in cross-linking structural proteins to hardening the inner root sheath.

Cellular Location

Cytoplasm.

TGM3 Antibody (C-term) Blocking Peptide - Background

Transglutaminases are enzymes that catalyze the crosslinking of proteins by epsilon-gamma glutamyl lysineisopeptide bonds. While the primary structure of transglutaminasesis not conserved, they all have the same amino acid sequence attheir active sites and their activity is calcium-dependent. The protein encoded by this gene consists of two polypeptide chainsactivated from a single precursor protein by proteolysis. Theencoded protein is involved the later stages of cell envelopeformation in the epidermis and hair follicle.
