

# **ATG12 Antibody Blocking peptide**

Synthetic peptide Catalog # BP1816c

## **Specification**

# ATG12 Antibody Blocking peptide - Product Information

**Primary Accession** 

094817

# ATG12 Antibody Blocking peptide - Additional Information

**Gene ID 9140** 

#### **Other Names**

Ubiquitin-like protein ATG12, Autophagy-related protein 12, APG12-like, ATG12, APG12L

### Target/Specificity

The synthetic peptide sequence used to generate the antibody <a href=/product/products/AP1816c>AP1816c</a> was selected from the P46 region of human Autophagy APG12L. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

#### **Format**

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

#### Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

### **Precautions**

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

# ATG12 Antibody Blocking peptide - Protein Information

Name ATG12 (HGNC:588)

Synonyms APG12, APG12L

### **Function**

Ubiquitin-like protein involved in autophagy vesicles formation. Conjugation with ATG5 through a ubiquitin-like conjugating system involving also ATG7 as an E1-like activating enzyme and ATG10 as an E2-like conjugating enzyme, is essential for its function. The ATG12-ATG5 conjugate acts as an E3-like enzyme which is required for lipidation of ATG8 family proteins and their association to the vesicle membranes.

# **Cellular Location**

Cytoplasm. Preautophagosomal structure membrane; Peripheral membrane protein. Note=TECPR1 recruits the ATG12- ATG5 conjugate to the autolysosomal membrane

Tissue Location Ubiquitous..

# **ATG12 Antibody Blocking peptide - Protocols**

Provided below are standard protocols that you may find useful for product applications.

# ATG12 Antibody Blocking peptide - Background

Macroautophagy is the major inducible pathway for the general turnover of cytoplasmic constituents in eukaryotic cells, it is also responsible for the degradation of active cytoplasmic enzymes and organelles during nutrient starvation. Macroautophagy involves the formation of double-membrane bound autophagosomes which enclose the cytoplasmic constituent targeted for degradation in a membrane bound structure, which then fuse with the lysosome (or vacuole) releasing a single-membrane bound autophagic bodies which are then degraded within the lysosome (or vacuole). APG12L is the human homolog of yeast APG12, a ubiquitin-activating enzyme E1-like protein essential for the conjugation system that mediates membrane fusion in autophagy.
