

HIST1H2BA Antibody (N-term) Blocking Peptide

Synthetic peptide Catalog # BP18457a

Specification

HIST1H2BA Antibody (N-term) Blocking Peptide - Product Information

Primary Accession

Q96A08

HIST1H2BA Antibody (N-term) Blocking Peptide - Additional Information

Gene ID 255626

Other Names

Histone H2B type 1-A, Histone H2B, testis, TSH2B1, Testis-specific histone H2B, HIST1H2BA, TSH2B

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

HIST1H2BA Antibody (N-term) Blocking Peptide - Protein Information

Name H2BC1 (HGNC:18730)

Function

Variant histone specifically required to direct the transformation of dissociating nucleosomes to protamine in male germ cells (By similarity). Entirely replaces classical histone H2B prior nucleosome to protamine transition and probably acts as a nucleosome dissociating factor that creates a more dynamic chromatin, facilitating the large-scale exchange of histones (By similarity). Core component of nucleosome (By similarity). Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template (By similarity). Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability (By similarity). DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling (By similarity). Also found in fat cells, its function and the presence of post-translational modifications specific to such cells are still unclear (PubMed:21249133).

Cellular Location

Nucleus {ECO:0000250|UniProtKB:P70696}. Chromosome {ECO:0000250|UniProtKB:P70696}

Tissue Location

Mainly expressed in testis, and the corresponding protein is also present in mature sperm (at protein level). Also found in some fat cells.

HIST1H2BA Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

HIST1H2BA Antibody (N-term) Blocking Peptide - Background

Histones are basic nuclear proteins that are responsiblefor the nucleosome structure of the chromosomal fiber ineukaryotes. Nucleosomes consist of approximately 146 bp of DNAwrapped around a histone octamer composed of pairs of each of thefour core histones (H2A, H2B, H3, and H4). The chromatin fiber isfurther compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatinstructures. This gene is intronless and encodes atestis/sperm-specific member of the histone H2B family. Transcriptsfrom this gene contain a palindromic termination element. [providedby RefSeq].
