DCAF12L2 Antibody (C-term) Blocking Peptide - Background

This gene encodes a member of the WD repeat proteinfamily. WD repeats are minimally conserved regions of approximately40 amino acids typically bracketed by Gly-His and Trp-Asp (GH-WD), which may facilitate formation of heterotrimeric or multi-proteincomplexes. Members of this family are involved in a variety ofcellular processes, including cell cycle progression, signaltransduction, apoptosis, and gene regulation. This gene appears to represent an intronless retrocopy of a related

multi-exon genelocated on chromosome 9. However, the CDS of this intronless generemains intact, it is conserved in other mammalian species, it isknown to be transcribed, and it is therefore thought to encode afunctional protein.
