

RBL1 Antibody(C-term) Blocking peptide Synthetic peptide Catalog # BP19390b

Specification

RBL1 Antibody(C-term) Blocking peptide - Product Information

Primary Accession

<u>P28749</u>

RBL1 Antibody(C-term) Blocking peptide - Additional Information

Gene ID 5933

Other Names

Retinoblastoma-like protein 1, 107 kDa retinoblastoma-associated protein, p107, pRb1, RBL1

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions This product is for research use only. Not for use in diagnostic or therapeutic procedures.

RBL1 Antibody(C-term) Blocking peptide - Protein Information

Name RBL1

Function

Key regulator of entry into cell division (PubMed:17671431). Directly involved in heterochromatin formation by maintaining overall chromatin structure and, in particular, that of constitutive heterochromatin by stabilizing histone methylation (By similarity). Recruits and targets histone methyltransferases KMT5B and KMT5C, leading to epigenetic transcriptional repression (By similarity). Controls histone H4 'Lys-20' trimethylation (By similarity). Probably acts as a transcription repressor by recruiting chromatin-modifying enzymes to promoters (By similarity). Potent inhibitor of E2F-mediated trans-activation (PubMed:8319904). May act as a tumor suppressor (PubMed:8319904).

Cellular Location Nucleus.

RBL1 Antibody(C-term) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

RBL1 Antibody(C-term) Blocking peptide - Background

The protein encoded by this gene is similar in sequenceand possibly function to the product of the retinoblastoma 1 (RB1)gene. The RB1 gene product is a tumor suppressor protein thatappears to be involved in cell cycle regulation, as it isphosphorylated in the S to M phase transition and isdephosphorylated in the G1 phase of the cell cycle. Both the RB1protein and the product of this gene can form a complex withadenovirus E1A protein and SV40 large T-antigen, with the SV40large T-antigen binding only to the unphosphorylated form of eachprotein. In addition, both proteins can inhibit the transcription cell cycle genes containing E2F binding sites in theirpromoters. Due to the sequence and biochemical similarities withthe RB1 protein, it is thought that the protein encoded by thisgene may also be a tumor suppressor. Two transcript variantsencoding different isoforms have been found for this gene.
