

CCR5 Antibody(Center) Blocking peptide Synthetic peptide Catalog # BP19617c

## Specification

# CCR5 Antibody(Center) Blocking peptide - Product Information

Primary Accession

<u>P51681</u>

# CCR5 Antibody(Center) Blocking peptide - Additional Information

Gene ID 1234

**Other Names** 

C-C chemokine receptor type 5, C-C CKR-5, CC-CKR-5, CCR-5, CCR5, CHEMR13, HIV-1 fusion coreceptor, CD195, CCR5, CMKBR5

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

**Storage** Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

**Precautions** This product is for research use only. Not for use in diagnostic or therapeutic procedures.

### CCR5 Antibody(Center) Blocking peptide - Protein Information

Name CCR5 (HGNC:1606)

Synonyms CMKBR5

#### Function

Receptor for a number of inflammatory CC-chemokines including CCL3/MIP-1-alpha, CCL4/MIP-1-beta and RANTES and subsequently transduces a signal by increasing the intracellular calcium ion level. May play a role in the control of granulocytic lineage proliferation or differentiation. Participates in T-lymphocyte migration to the infection site by acting as a chemotactic receptor (PubMed:<a href="http://www.uniprot.org/citations/30713770" target="\_blank">30713770</a>).

**Cellular Location** Cell membrane; Multi-pass membrane protein

#### **Tissue Location**

Highly expressed in spleen, thymus, in the myeloid cell line THP-1, in the promyeloblastic cell line KG-1a and on CD4+ and CD8+ T-cells. Medium levels in peripheral blood leukocytes and in small intestine. Low levels in ovary and lung.

# CCR5 Antibody(Center) Blocking peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

## CCR5 Antibody(Center) Blocking peptide - Background

This gene encodes a member of the beta chemokine receptorfamily, which is predicted to be a seven transmembrane proteinsimilar to G protein-coupled receptors. This protein is expressedby T cells and macrophages, and is known to be an important co-receptor for macrophage-tropic virus, including HIV, to enterhost cells. Defective alleles of this gene have been associated with the HIV infection resistance. The ligands of this receptorinclude monocyte chemoattractant protein 2 (MCP-2), macrophageinflammatory protein 1 alpha (MIP-1 alpha), macrophage inflammatory protein 1 beta (MIP-1 beta) and regulated on activation normal Texpressed and secreted protein (RANTES). Expression of this genewas also detected in a promyeloblastic cell line, suggesting thatthis protein may play a role in granulocyte lineage proliferationand differentiation. This gene is located at the chemokine receptorgene cluster region. Two transcript variants encoding the sameprotein have been found for this gene.
