

ATP5E Blocking Peptide (C-Term) Synthetic peptide Catalog # BP21888b

Specification

ATP5E Blocking Peptide (C-Term) - Product Information

Primary Accession

<u>P56381</u>

ATP5E Blocking Peptide (C-Term) - Additional Information

Gene ID 514

Other Names ATP synthase subunit epsilon, mitochondrial, ATPase subunit epsilon, ATP5E

Target/Specificity

The synthetic peptide sequence is selected from aa 41-51 of HUMAN ATP5E

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions This product is for research use only. Not for use in diagnostic or therapeutic procedures.

ATP5E Blocking Peptide (C-Term) - Protein Information

Name ATP5F1E (HGNC:838)

Function

Mitochondrial membrane ATP synthase (F(1)F(0) ATP synthase or Complex V) produces ATP from ADP in the presence of a proton gradient across the membrane which is generated by electron transport complexes of the respiratory chain. F-type ATPases consist of two structural domains, F(1) - containing the extramembraneous catalytic core, and F(0) - containing the membrane proton channel, linked together by a central stalk and a peripheral stalk. During catalysis, ATP synthesis in the catalytic domain of F(1) is coupled via a rotary mechanism of the central stalk subunits to proton translocation. Part of the complex F(1) domain and of the central stalk which is part of the complex rotary element. Rotation of the central stalk against the surrounding alpha(3)beta(3) subunits leads to hydrolysis of ATP in three separate catalytic sites on the beta subunits (By similarity).

Cellular Location Mitochondrion. Mitochondrion inner membrane.

Tissue Location

Ubiquitous.

ATP5E Blocking Peptide (C-Term) - Protocols

Provided below are standard protocols that you may find useful for product applications.
