

**Phospho-PAX6(T373) Antibody Blocking peptide**  
**Synthetic peptide**  
**Catalog # BP3718a****Specification**

---

**Phospho-PAX6(T373) Antibody Blocking peptide - Product Information**Primary Accession [P26367](#)**Phospho-PAX6(T373) Antibody Blocking peptide - Additional Information****Gene ID** 5080**Other Names**

Paired box protein Pax-6, Aniridia type II protein, Oculorhombin, PAX6, AN2

**Format**

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

**Storage**

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

**Precautions**

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

**Phospho-PAX6(T373) Antibody Blocking peptide - Protein Information****Name** PAX6**Synonyms** AN2**Function**

Transcription factor with important functions in the development of the eye, nose, central nervous system and pancreas. Required for the differentiation of pancreatic islet alpha cells (By similarity). Competes with PAX4 in binding to a common element in the glucagon, insulin and somatostatin promoters. Regulates specification of the ventral neuron subtypes by establishing the correct progenitor domains (By similarity). Acts as a transcriptional repressor of NFATC1- mediated gene expression (By similarity).

**Cellular Location**

Nucleus {ECO:0000250|UniProtKB:P63015}. [Isoform 5a]: Nucleus {ECO:0000250|UniProtKB:P63016}

**Tissue Location**

[Isoform 1]: Expressed in lymphoblasts.

## **Phospho-PAX6(T373) Antibody Blocking peptide - Protocols**

Provided below are standard protocols that you may find useful for product applications.

## **Phospho-PAX6(T373) Antibody Blocking peptide - Background**

This gene encodes paired box gene 6, one of many human homologs of the *Drosophila melanogaster* gene *prd*. In addition to the hallmark feature of this gene family, a conserved paired box domain, the encoded protein also contains a homeo box domain. Both domains are known to bind DNA, and function as regulators of gene transcription. This gene is expressed in the developing nervous system, and in developing eyes.
