

Parg Antibody (C-term) Blocking Peptide
Synthetic peptide
Catalog # BP7283b**Specification**

Parg Antibody (C-term) Blocking Peptide - Product InformationPrimary Accession [Q86W56](#)**Parg Antibody (C-term) Blocking Peptide - Additional Information****Gene ID** 670;8505**Other Names**

Poly(ADP-ribose) glycohydrolase, PARG

Target/Specificity

The synthetic peptide sequence used to generate the antibody [AP7283b](/product/products/AP7283b) was selected from the C-term region of human Parg. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

Parg Antibody (C-term) Blocking Peptide - Protein Information**Name** PARG {ECO:0000303|PubMed:14527731, ECO:0000312|HGNC:HGNC:8605}**Function**

Poly(ADP-ribose) glycohydrolase that degrades poly(ADP- ribose) by hydrolyzing the ribose-ribose bonds present in poly(ADP- ribose) (PubMed: [15450800](http://www.uniprot.org/citations/15450800), PubMed: [21892188](http://www.uniprot.org/citations/21892188), PubMed: [23102699](http://www.uniprot.org/citations/23102699), PubMed: [23474714](http://www.uniprot.org/citations/23474714), PubMed: [33186521](http://www.uniprot.org/citations/33186521), PubMed: [34321462](http://www.uniprot.org/citations/34321462), PubMed: [34019811](http://www.uniprot.org/citations/34019811)). PARG acts both as an endo- and exoglycosidase, releasing poly(ADP- ribose) of different length as well as ADP-ribose monomers (PubMed: [23102699](http://www.uniprot.org/citations/23102699), PubMed: [23481255](http://www.uniprot.org/citations/23481255)). It is however

unable to cleave the ester bond between the terminal ADP-ribose and ADP-ribosylated residues, leaving proteins that are mono-ADP-ribosylated (PubMed:21892188, PubMed:23474714, PubMed:33186521). Poly(ADP-ribose) is synthesized after DNA damage is only present transiently and is rapidly degraded by PARG (PubMed:23102699, PubMed:34019811). Required to prevent detrimental accumulation of poly(ADP-ribose) upon prolonged replicative stress, while it is not required for recovery from transient replicative stress (PubMed:24906880). Responsible for the prevalence of mono-ADP-ribosylated proteins in cells, thanks to its ability to degrade poly(ADP-ribose) without cleaving the terminal protein-ribose bond (PubMed:33186521). Required for retinoid acid- dependent gene transactivation, probably by removing poly(ADP-ribose) from histone demethylase KDM4D, allowing chromatin derepression at RAR- dependent gene promoters (PubMed:23102699). Involved in the synthesis of ATP in the nucleus, together with PARP1, NMNAT1 and NUDT5 (PubMed:27257257). Nuclear ATP generation is required for extensive chromatin remodeling events that are energy-consuming (PubMed:27257257).

Cellular Location

[Isoform 1]: Nucleus Note=Colocalizes with PCNA at replication foci (PubMed:21398629)
Relocalizes to the cytoplasm in response to DNA damage (PubMed:16460818). [Isoform 3]:
Cytoplasm [Isoform 5]: Mitochondrion matrix

Tissue Location

Ubiquitously expressed.

Parg Antibody (C-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

Parg Antibody (C-term) Blocking Peptide - Background

Poly(ADP-ribose) glycohydrolase (PARG) is the major enzyme responsible for the catabolism of poly(ADP-ribose), a reversible covalent-modifier of chromosomal proteins. The protein is found in many tissues and may be subject to proteolysis generating smaller, active products.
