

**EphA7 Antibody Blocking Peptide**  
**Synthetic peptide**  
**Catalog # BP7612d****Specification**

---

**EphA7 Antibody Blocking Peptide - Product Information**Primary Accession [Q15375](#)**EphA7 Antibody Blocking Peptide - Additional Information****Gene ID** 2045**Other Names**

Ephrin type-A receptor 7, EPH homology kinase 3, EHK-3, EPH-like kinase 11, EK11, hEK11, EPHA7, EHK3, HEK11

**Target/Specificity**

The synthetic peptide sequence used to generate the antibody [BP7612d](#) was selected from the region of human EphA7. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

**Format**

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

**Storage**

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

**Precautions**

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

**EphA7 Antibody Blocking Peptide - Protein Information****Name** EPHA7**Synonyms** EHK3, HEK11**Function**

Receptor tyrosine kinase which binds promiscuously GPI- anchored ephrin-A family ligands residing on adjacent cells, leading to contact-dependent bidirectional signaling into neighboring cells. The signaling pathway downstream of the receptor is referred to as forward signaling while the signaling pathway downstream of the ephrin ligand is referred to as reverse signaling. Among GPI-anchored ephrin-A ligands, EFNA5 is a cognate/functional ligand for EPHA7 and their interaction regulates brain development modulating cell-cell adhesion and repulsion. Has a repellent activity on axons and is for instance involved in the guidance of corticothalamic axons and in the proper topographic mapping of retinal axons to the colliculus. May also regulate brain development through a caspase(CASP3)-dependent proapoptotic activity. Forward signaling may result in activation of components of the ERK signaling pathway including MAP2K1, MAP2K2,

MAPK1 and MAPK3 which are phosphorylated upon activation of EPHA7.

**Cellular Location**

Cell membrane; Single-pass type I membrane protein

**Tissue Location**

Widely expressed.

**EphA7 Antibody Blocking Peptide - Protocols**

Provided below are standard protocols that you may find useful for product applications.

**EphA7 Antibody Blocking Peptide - Images****EphA7 Antibody Blocking Peptide - Background**

EphA7 belongs to the ephrin receptor subfamily of the protein-tyrosine kinase family. EPH and EPH-related receptors have been implicated in mediating developmental events, particularly in the nervous system. Receptors in the EPH subfamily typically have a single kinase domain and an extracellular region containing a Cys-rich domain and 2 fibronectin type III repeats. The ephrin receptors are divided into 2 groups based on the similarity of their extracellular domain sequences and their affinities for binding ephrin-A and ephrin-B ligands.[1]
