

GCK Antibody (N-term) Blocking Peptide
Synthetic peptide
Catalog # BP7901a**Specification**

GCK Antibody (N-term) Blocking Peptide - Product InformationPrimary Accession [P35557](#)**GCK Antibody (N-term) Blocking Peptide - Additional Information****Gene ID** 2645**Other Names**

Glucokinase, Hexokinase type IV, HK IV, Hexokinase-4, HK4, Hexokinase-D, GCK

Target/Specificity

The synthetic peptide sequence used to generate the antibody [AP7901a](/product/products/AP7901a) was selected from the N-term region of human GCK. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

GCK Antibody (N-term) Blocking Peptide - Protein Information**Name** GCK {ECO:0000303|PubMed:17573900, ECO:0000312|HGNC:HGNC:4195}**Function**

Catalyzes the phosphorylation of hexose, such as D-glucose, D-fructose and D-mannose, to hexose 6-phosphate (D-glucose 6-phosphate, D-fructose 6-phosphate and D-mannose 6-phosphate, respectively) (PubMed:[7742312](http://www.uniprot.org/citations/7742312), PubMed:[11916951](http://www.uniprot.org/citations/11916951), PubMed:[15277402](http://www.uniprot.org/citations/15277402), PubMed:[17082186](http://www.uniprot.org/citations/17082186), PubMed:[18322640](http://www.uniprot.org/citations/18322640), PubMed:[19146401](http://www.uniprot.org/citations/19146401), PubMed:[25015100](http://www.uniprot.org/citations/25015100), PubMed:[8325892](http://www.uniprot.org/citations/8325892)). Compared to other hexokinases, has a weak affinity for D-glucose, and is effective only when glucose is abundant (By similarity). Mainly expressed in

pancreatic beta cells and the liver and constitutes a rate-limiting step in glucose metabolism in these tissues (PubMed:[18322640](http://www.uniprot.org/citations/18322640), PubMed:[25015100](http://www.uniprot.org/citations/25015100), PubMed:[8325892](http://www.uniprot.org/citations/8325892), PubMed:[11916951](http://www.uniprot.org/citations/11916951), PubMed:[15277402](http://www.uniprot.org/citations/15277402)). Since insulin secretion parallels glucose metabolism and the low glucose affinity of GCK ensures that it can change its enzymatic activity within the physiological range of glucose concentrations, GCK acts as a glucose sensor in the pancreatic beta cell (By similarity). In pancreas, plays an important role in modulating insulin secretion (By similarity). In liver, helps to facilitate the uptake and conversion of glucose by acting as an insulin-sensitive determinant of hepatic glucose usage (By similarity). Required to provide D-glucose 6-phosphate for the synthesis of glycogen (PubMed:[8878425](http://www.uniprot.org/citations/8878425)). Mediates the initial step of glycolysis by catalyzing phosphorylation of D-glucose to D-glucose 6-phosphate (PubMed:[7742312](http://www.uniprot.org/citations/7742312)).

Cellular Location

Cytoplasm. Nucleus. Mitochondrion {ECO:0000250|UniProtKB:P17712}. Note=Under low glucose concentrations, GCK associates with GCKR and the inactive complex is recruited to the hepatocyte nucleus.

GCK Antibody (N-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

GCK Antibody (N-term) Blocking Peptide - Background

Hexokinases phosphorylate glucose to produce glucose-6-phosphate, thus committing glucose to the glycolytic pathway. Alternative splicing of the gene for GCK results in three tissue-specific forms of glucokinase, one found in pancreatic islet beta cells and two found in liver. The protein localizes to the outer membrane of mitochondria. In contrast to other forms of hexokinase, this enzyme is not inhibited by its product glucose-6-phosphate but remains active while glucose is abundant. Mutations in the gene have been associated with non-insulin dependent diabetes mellitus (NIDDM), also called maturity onset diabetes of the young, type 2 (MODY2); mutations have also been associated with persistent hyperinsulinemic hypoglycemia of infancy (PHHI).
