

**PAK2 Antibody (N-term) Blocking Peptide**  
**Synthetic peptide**  
**Catalog # BP7927d**

**Specification**

**PAK2 Antibody (N-term) Blocking Peptide - Product Information**

Primary Accession [Q13177](#)

**PAK2 Antibody (N-term) Blocking Peptide - Additional Information**

**Gene ID** 5062

**Other Names**

Serine/threonine-protein kinase PAK 2, Gamma-PAK, PAK65, S6/H4 kinase, p21-activated kinase 2, PAK-2, p58, PAK-2p27, p27, PAK-2p34, p34, C-t-PAK2, PAK2

**Target/Specificity**

The synthetic peptide sequence used to generate the antibody <a href=/product/products/AP7927d>AP7927d</a> was selected from the N-term region of human PAK2. A 10 to 100 fold molar excess to antibody is recommended. Precise conditions should be optimized for a particular assay.

**Format**

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

**Storage**

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

**Precautions**

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

**PAK2 Antibody (N-term) Blocking Peptide - Protein Information**

**Name** PAK2

**Function**

Serine/threonine protein kinase that plays a role in a variety of different signaling pathways including cytoskeleton regulation, cell motility, cell cycle progression, apoptosis or proliferation (PubMed:<a href="http://www.uniprot.org/citations/7744004" target="\_blank">7744004</a>, PubMed:<a href="http://www.uniprot.org/citations/19273597" target="\_blank">19273597</a>, PubMed:<a href="http://www.uniprot.org/citations/19923322" target="\_blank">19923322</a>, PubMed:<a href="http://www.uniprot.org/citations/9171063" target="\_blank">9171063</a>, PubMed:<a href="http://www.uniprot.org/citations/12853446" target="\_blank">12853446</a>, PubMed:<a href="http://www.uniprot.org/citations/16617111" target="\_blank">16617111</a>, PubMed:<a href="http://www.uniprot.org/citations/33693784" target="\_blank">33693784</a>). Acts as a downstream effector of the small GTPases CDC42 and RAC1 (PubMed:<a href="http://www.uniprot.org/citations/7744004" target="\_blank">7744004</a>). Activation by

the binding of active CDC42 and RAC1 results in a conformational change and a subsequent autophosphorylation on several serine and/or threonine residues (PubMed:<a href="http://www.uniprot.org/citations/7744004" target="\_blank">7744004</a>). Full-length PAK2 stimulates cell survival and cell growth (PubMed:<a href="http://www.uniprot.org/citations/7744004" target="\_blank">7744004</a>). Phosphorylates MAPK4 and MAPK6 and activates the downstream target MAPKAPK5, a regulator of F-actin polymerization and cell migration (PubMed:<a href="http://www.uniprot.org/citations/21317288" target="\_blank">21317288</a>). Phosphorylates JUN and plays an important role in EGF-induced cell proliferation (PubMed:<a href="http://www.uniprot.org/citations/21177766" target="\_blank">21177766</a>). Phosphorylates many other substrates including histone H4 to promote assembly of H3.3 and H4 into nucleosomes, BAD, ribosomal protein S6, or MBP (PubMed:<a href="http://www.uniprot.org/citations/21724829" target="\_blank">21724829</a>). Phosphorylates CASP7, thereby preventing its activity (PubMed:<a href="http://www.uniprot.org/citations/21555521" target="\_blank">21555521</a>, PubMed:<a href="http://www.uniprot.org/citations/27889207" target="\_blank">27889207</a>). Additionally, associates with ARHGEF7 and GIT1 to perform kinase-independent functions such as spindle orientation control during mitosis (PubMed:<a href="http://www.uniprot.org/citations/19273597" target="\_blank">19273597</a>, PubMed:<a href="http://www.uniprot.org/citations/19923322" target="\_blank">19923322</a>). On the other hand, apoptotic stimuli such as DNA damage lead to caspase-mediated cleavage of PAK2, generating PAK-2p34, an active p34 fragment that translocates to the nucleus and promotes cellular apoptosis involving the JNK signaling pathway (PubMed:<a href="http://www.uniprot.org/citations/9171063" target="\_blank">9171063</a>, PubMed:<a href="http://www.uniprot.org/citations/12853446" target="\_blank">12853446</a>, PubMed:<a href="http://www.uniprot.org/citations/16617111" target="\_blank">16617111</a>). Caspase-activated PAK2 phosphorylates MKNK1 and reduces cellular translation (PubMed:<a href="http://www.uniprot.org/citations/15234964" target="\_blank">15234964</a>).

### **Cellular Location**

[Serine/threonine-protein kinase PAK 2]: Cytoplasm Nucleus Note=MYO18A mediates the cellular distribution of the PAK2-ARHGEF7-GIT1 complex to the inner surface of the cell membrane

### **Tissue Location**

Ubiquitously expressed. Higher levels seen in skeletal muscle, ovary, thymus and spleen

### **PAK2 Antibody (N-term) Blocking Peptide - Protocols**

Provided below are standard protocols that you may find useful for product applications.

### **PAK2 Antibody (N-term) Blocking Peptide - Background**

PAK2, a member of the STE20 subfamily of Ser/Thr protein kinases, acts on a variety of targets. It phosphorylates ribosomal protein S6, histone H4 and myelin basic protein. PAK2 interacts tightly with GTP-bound but not GDP-bound CDC42/p21 and RAC1. Expression is ubiquitous, with higher levels seen in skeletal muscle, ovary, thymus and spleen. PAK2 is autophosphorylated when activated by CDC42/p21. The protein structure contains 1 CRIB domain.
