

EFNA3 Antibody (C-term) Blocking Peptide
Synthetic peptide
Catalog # BP9484b**Specification**

EFNA3 Antibody (C-term) Blocking Peptide - Product InformationPrimary Accession [P52797](#)**EFNA3 Antibody (C-term) Blocking Peptide - Additional Information****Gene ID** 1944**Other Names**

Ephrin-A3, EFL-2, EHK1 ligand, EHK1-L, EPH-related receptor tyrosine kinase ligand 3, LERK-3, EFNA3, EFL2, EPLG3, LERK3

Format

Peptides are lyophilized in a solid powder format. Peptides can be reconstituted in solution using the appropriate buffer as needed.

Storage

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C.

Precautions

This product is for research use only. Not for use in diagnostic or therapeutic procedures.

EFNA3 Antibody (C-term) Blocking Peptide - Protein Information**Name** EFNA3**Synonyms** EFL2, EPLG3, LERK3**Function**

Cell surface GPI-bound ligand for Eph receptors, a family of receptor tyrosine kinases which are crucial for migration, repulsion and adhesion during neuronal, vascular and epithelial development. Binds promiscuously Eph receptors residing on adjacent cells, leading to contact-dependent bidirectional signaling into neighboring cells. The signaling pathway downstream of the receptor is referred to as forward signaling while the signaling pathway downstream of the ephrin ligand is referred to as reverse signaling (By similarity).

Cellular Location

Cell membrane; Lipid-anchor, GPI-anchor.

Tissue Location

Expressed in brain, skeletal muscle, spleen, thymus, prostate, testis, ovary, small intestine, and peripheral blood leukocytes

EFNA3 Antibody (C-term) Blocking Peptide - Protocols

Provided below are standard protocols that you may find useful for product applications.

EFNA3 Antibody (C-term) Blocking Peptide - Background

EFNA is a member of the ephrin (EPH) family. The ephrins and EPH-related receptors comprise the largest subfamily of receptor protein-tyrosine kinases and have been implicated in mediating developmental events, especially in the nervous system and in erythropoiesis. Based on their structures and sequence relationships, ephrins are divided into the ephrin-A (EFNA) class, which are anchored to the membrane by a glycosylphosphatidylinositol linkage, and the ephrin-B (EFNB) class, which are transmembrane proteins.
