

Src1, Active recombinant protein

Src, v-src sarcoma (Schmidt-Ruppin A-2) viral oncogene homolog Catalog # PBV11325r

Specification

Src1, Active recombinant protein - Product info

| Primary Accession | <u>P12931</u> |
|-------------------|---------------|
| Concentration | 0.1 |
| Calculated MW | 85.0 kDa KDa |

Src1, Active recombinant protein - Additional Info

Gene ID Gene Symbol Other Names

Src, v-src sarcoma (Schmidt-Ruppin A-2) viral oncogene homolog, Class E basic helix-loop-helix protein 74, Short name=bHLHe74, Protein Hin-2, RIP160, Renal carcinoma antigen NY-REN-52, Steroid receptor coactivator 1

6714

SRC

| Source |
|----------------|
| Assay&Purity |
| Assay2&Purity2 |
| Recombinant |
| Format |
| Liquid |

Baculovirus (Sf9 insect cells) SDS-PAGE; ≥90% HPLC; Yes

Storage

-80°C; Recombinant proteins in storage buffer (50 mM Tris-HCl, pH 7.5, 150 mM NaCl, 0.25 mM DTT, 0.1 mM EGTA, 0.1 mM EDTA, 0.1 mM PMSF, 25% glycerol).

Src1, Active recombinant protein - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- Immunohistochemistry
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- <u>Cell Culture</u>

Src1, Active recombinant protein - Images

Src1, Active recombinant protein - Background

Src family belongs to non-receptor tyrosine kinases. Src was originally identified as a transforming protein of the Rous sarcoma virus (RSV) that had enzymatic ability to phosphorylate tyrosine in

protein substrates. Src is overexpressed and activated in a large number of human malignancies and has been linked to the development of cancer and progression to distant metastases. In addition to increasing cell proliferation, a key role of Src in cancer seems to be the ability to promote invasion and motility, functions that might contribute to tumour progression. Oncogenic forms of the Src alter cell structure, in particular the actin cytoskeleton and the adhesion networks that control cell migration, and also transmit signals that regulate proliferation and cell survival. Recent work indicates that Src plays a role in these functions by influencing the RhoA-ROCK pathway that controls contractile actin filament assembly, the STAT family of transcription factors needed for transformation, and the Cbl ubiquitin ligase that controls Src protein levels. These studies also shed light on the role of focal adhesion kinase (FAK) downstream of v-Src and other signaling pathways in controlling migration, invasion and survival of transformed cells. Src directly phosphorylates integrins and can also modulate R-Ras activity. Moreover, it stimulates the E-cadherin regulator Hakai, interacts with and phosphorylates the novel podosome-linked adaptor protein Fish, and progressively phosphorylates the gap junction component connexion 43. In addition to the above functions and substrates, the role in cellular physiology of Src is continually expanding.
